

3. Priority Workflow 1 — Find and Save an Activity

3.1 Workflow Purpose

The purpose of this workflow is to allow a STEMMate user to find a suitable self-reflection or personal-development activity, view its details, and save it for later use. The workflow supports users who may want to explore activities at their own pace, particularly when internet access is limited or unreliable.

The workflow begins from the activity browser, where the user can search or browse available activities. The user can then select an activity, review its description and requirements, and save it to their personal activity list. The design focuses on simple navigation, clear instructions, accessible content and minimal personal-data collection.

3.2 Workflow

The workflow is accessed through the **Activities** section of the STEMMate prototype.

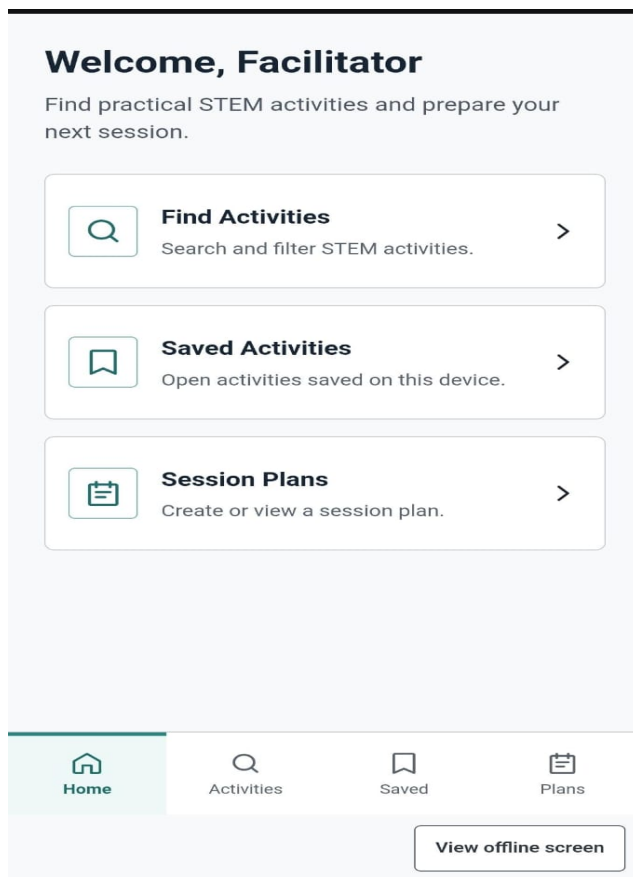

Main path:

Activities → Activity Browser → Select Activity → Activity Details → Save confirmation → Saved Activities

<https://www.figma.com/proto/IJE1ZGdX4VI9f6tbWUJU1s?node-id=0-1&t=FwHqNt1i7Q6hzXXC-6>

The user does not need to provide unnecessary personal information to browse the activities. This supports the privacy requirements carried forward from A1.

3.3 Activity Browser

The Activity Browser presents available STEMMate activities in a simple and organised format. Each activity is displayed as a selectable card containing a clear title, short description and relevant category or topic.

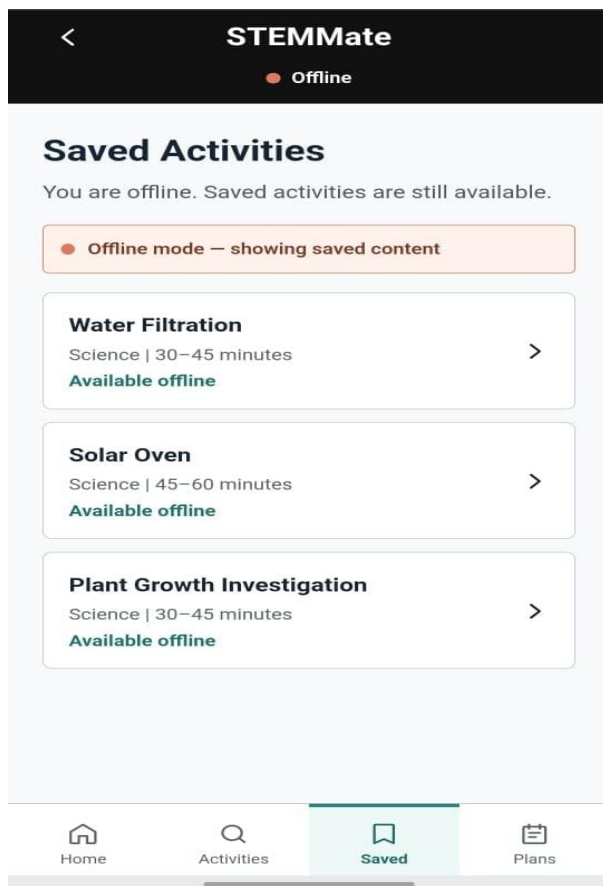

The browser allows the user to quickly identify an activity that is relevant to their needs. The interface avoids presenting too much information at once and uses clear labels so that users can understand what each activity is about before opening it.

The prototype considers users who may have limited bandwidth or low-specification devices. Therefore, the activity browser is designed to use lightweight content and avoid unnecessary visual elements.

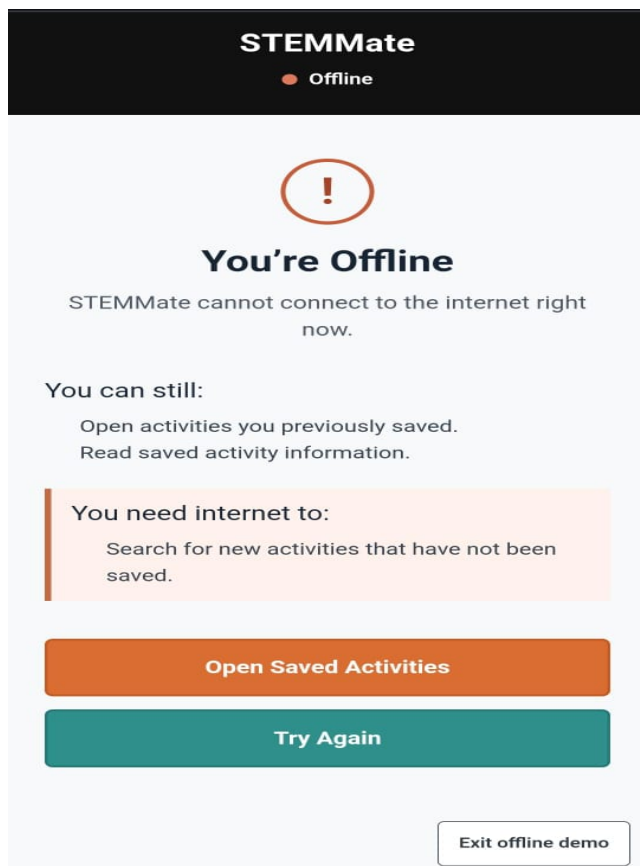

Prototype evidence:

The activity-browser screen demonstrates how the user can browse available activities and select one for further information.

3.4 Activity Details

3.5 Offline Saving

3.6 Requirements Covered

REQUIREMENT	How the workflow addresses it
FR-02	Allows users to find information and activities related to healthy responses and personal development.
FR-05	Provides access to self-reflection and personal-development activities.
QR-02	Does not require unnecessary personal information when browsing or saving activities.
QR-03	Uses readable text, clear labels, simple navigation and accessible interaction.
QR-04	Uses clear, respectful and non-judgemental language.
QR-05	Uses lightweight activity content to support reasonable loading performance under defined conditions.

The workflow therefore connects the prototype interface to the refined requirements and demonstrates how the requirements are translated into an actual user interaction.

3.7 Prototype Considerations

Prototype

The prototype allows the user to **browse activities, select an activity, view its details, and save it for later.**

Prototype flow:

Activities → Browse Activities → Select Activity → View Details → Save Activity

The activity browser displays simple activity cards with a title and short description. When the user selects an activity, the details page provides the activity instructions and a **Save Activity** button.

The prototype also considers limited internet access by providing feedback when an activity is saved or when saving fails. The interface uses clear labels, readable text and simple navigation to support accessibility and ease of use.

Main screens:

1. Activity Browser
2. Activity Details
3. Saved Activity
4. Offline/Save Feedback
